

History Interactive Petrophysics is a petrophysicist's wet lab, and a representation of the petrophysical process. It is a suite of software programs that can be used by a range of disciplines such as geologists, reservoir engineers, environmental engineers, biochemists and others, to visualise and analyse subsurface data. IP also offers the widest flexibility of any petrophysical software to offer the perfect solution for most needs. It is the most powerful tool for interpreting subsurface data and building a model of a wellbore or reservoir. It can be used to simulate flow, build a reservoir model and correlate all the data to determine potential to produce or inject fluid into a well. Details Interactive Petrophysics is a suite of software programs that can be used by a range of disciplines including geologists, reservoir engineers, environmental engineers, biochemists and others, to visualise and analyse subsurface data. IP can be used to create a complete model of a wellbore or reservoir, from understanding the geology of the region to designing and analysing the flow of fluid. The IP suite offers two versions, plus a completely new version of IP that can be used to analyse subsurface data and build the best model of the region. The current version is IP 4.3, released in May, 2015, and the newest version available for downloading is IP 4.2, released in February, 2017. History The developers started working on an interactive version of Interactive Petrophysics since 2009. The first version appeared in July 2011 with the name "IPver". While the first version had a lot of problems, a new version came in 2016, it was named Interpetro 4.2, but later in 2018 it was released as Interactive Petrophysics 4.2. Features Features Interactive Petrophysics includes some of the most advanced features available. Its suite of programs includes the following: Flow Visualisation and Modelling Flow visualization and modeling is a powerful tool. It offers the capability to build the most complete model of a wellbore or reservoir, running every scenario through a complete range of flow, temperature and pressure conditions. Reservoir Modeling It builds a reservoir model based on a range of geological conditions and physical properties of the reservoir, including petrophysical properties such as wellbore fluid
